Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

PHOSPHORYLATION SITE SER-222.

Phosphorylation site SER-222.

Phosphorylation and linear ion trap mass spectrometry.";

Throsphoproteome analysis of mouse liver using immobilized metal

Throsphoproteome analysis of mouse liver using fetal development.";

Throsphorylation system and during fetal development. May be involved in nervous system development (By similarity). Plays an essential role in the initiation and/or maintenance of suckling in neonatal mice.

Throsphorylation sovalently linked di- and tetramers. Forms a heteromeric complex with cardiotrophin-like cytokine (CLC); the CELPI/CLC complex is a ligand for the ciliary neurotrophic factor receptor (CMTPR) (By similarity).

Throsphorylation secreted (By similarity).

Throsphorylation secreted (By similarity).

Throsphorylation secreted (By similarity).

Throsphorylation secreted (By similarity). Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalia; Butheria; Buarchontoglires; Glires; Rodentia; Sciurognathi; Muroidea; Muridae; Murinae; Mus. "Suckling defect in mice lacking the soluble haemopoietin receptor factor 1) FUNCTION, AND TISSUE SPECIFICITY.

PUNCTION, AND TISSUE SPECIFICITY.

Cytokine receptor-like factor 1 precursor (Cytokine-like factor 1 Cytokine receptor-like molecule 3) (CRLM-3) (NR6).
Name=Crlf1; Synonyms=Crlm3;
Mus musculus (Mouse). Hiroyama T., Iwama A., Nakamura Y., Nakauchi H.; Submitted (MAR-2000) to the EMBL/GenBank/DDBJ databases. 425 AA PRT; Curr. Biol. 9:605-608(1999). STANDARD; [1] NUCLEOTIDE SEQUENCE. NCBI_TaxID=10090; MOUSE MOUSE CRLF1 N

DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding.

SIMILARITY: Belongs to the type I cytokine receptor family. Type 3 ---

subfamily.
SIMILARITY: Contains 2 fibronectin type-III domains. + !

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fetal lung.

IMDUCTION: Up-regulated in fibroblast primary cell cultures under stimulation by IFN-gamma, ThY-alpha and IL-6.

DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding.

BISEASE: Defects in CRLFI are the cause of cold-induced sweating syndrome (CISS) [MIM:272430]. CISS is an autosomal recessive disorder characterized by profuse sweating induced by cool surroundings (temperatures of 7 to 18 degrees Celsius). Additional abnormalities include a high-arched palate, nasal voice, depressed nasal bridge, inability to fully extend the elbows and

J. Hum. Genet. 72:375-383(2003).

-!- FUNCTION: Cytokine receptor subunit, possibly playing a regulatory role in the immune system and during feral development. May be involved in nervous system and during feral development. May be involved in nervous system development.

-!- SUBUNIT: Forms covalently linked di- and tetramers. Forms a heteromeric complex with cardiotrophin-like cytokine (CLC); the CRLFI/CLC complex is a ligand for the ciliary neurotrophic factor receptor (CMPTR).

-!- SUBCELLULAR LOCATION: Secreted.
-! TISSUE SPECIPICITY: Highest levels of expression observed in spleen, thymus, lymph node, appendix, bone marrow, stomach, placenta, heart, thyroid and ovary. Strongly expressed also in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=22428294; PubMed=12509788; Knappskog P.M., Majewaki J., Livneh A., Nilsen P.T.E., Bringsli J.S., Ott J., Boman H., "Cold-induced sweating syndrome is caused by mutations in the CRLF!
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            kyphoscoliosis.
SIMILARITY: Belongs to the type I cytokine receptor family. Type
                                                                                                                                                                                                                                                                                                                                                  INTERACTIONS WITH CLC AND CNTFR.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.
-!- DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cellsurface receptor binding (By similarity).
-!- DOMAIN: The box 1 motif is required for JAK interaction and/or activation (By similarity).

Development 125:4791-4801(1998).
-!- DOMAIN: The WSXWS motif appear to be necessary for proper protein folding and thereby efficient intracelular transport and cell-surface receptor binding (By similarity).
-!- DOMAIN: The box 1 motif is required for JAK interaction and/or activation (By similarity).

Trott J.F., Hovey R.C., Koduri S., Vonderhaar B.K.;
Submitted (MMR-2002) to the EMBL/GenBank/DDB databases.
-!- DOMAIN: The WSXWS motif appear intracellular transport and cell-folding and thereby efficient intracellular transport and cell-surface receptor binding (By similarity).
-!- DOMAIN: The box 1 motif is required for JAK interaction and/or activation (By similarity).

New biologically active complex comprising NR6 and cardiotrophin-like-cytokine, for facilitating proliferation, differentiation and/or survival of a cell.

The present invention relates to a biologically active complex comprising a haemopoietin receptor, NR6 and cardiotrophin-like cytokine (CLC). The complex is useful in the manufacture of a medicament for the treatment and/or prophylaxis of a subject, as it is involved in facilitating proliferation, differentiation and/or survival of a cell. The complex or its components have neurotrophic activity. The present sequence is murine

The present sequence represents a novel type 1 cytokine receptor that has been termed human GBRI-ILR as it is believed to be an interleukin creceptor, or at least a substantial part of such a receptor. The sequence is predicted from an isolated full-length cDNA clone (see AAX25489) cobtained from a human placental CDNA library. GBRI-ILR mRNA is expressed cost strongly in spleen, thymus, lymph node, appendix, bone marrow, thyroid, adrenal cortex, stomach, heart, placenta and skeletal muscle, suggesting a role for GBRI-ILR in the immune system. In human foctal tissue, strong expression is seen in the lung, but not in brain, kidney cor liver. A GBRI-ILR receptor has also been identified in mice (see AAX05783). The high degree of conservation of amino acids between the human and murine polypeptides indicates that this receptor is concists and antagonists can be used to treat e.g. cancer, immune caponists and antagonists can be used to treat e.g. cancer, immune caponists can be used to treat e.g. cancer, immune capitally inview of homology to the leptin receptor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polymuclectides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes nucleic acids encoding PRO secreted and

                                                                                      The present sequence is a human U4 protein which is a member of haematopoietin receptor superfamily. The protein is predicted to have following biological activities: cytokine, cell proliferation/differentiation, immune stimulating or suppressing and haematopoiesis regulating. The U4 protein can be used to treat immune disorders and deficiencies, autoimmune disorders, allergies, cancer, myeloid or lymphoid cell deficiencies and platelet disorders
                                                                                                                                                                                                                                                                                                                                                         121 GSILAGSCLYVGLPPEKPVNISCWSKNMKDLTCRWTPGAHGETFLHTNYSLKYKLRWYCQ

New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources

The present sequence represents a novel human polypeptide. The specification describes novel polypeptides designated PRO21, PRO222, PRO327, PRO1265, PRO344, PRO344, PRO347, PRO345, PRO585, PRO345, PRO585, PRO585, PRO585, The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the identification of certain cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment and diagnosis of neoplastic cell growth and proliferation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neuro-muscular function; tumour; instruction; ustructions system; reproductive system; tumour; immune system; haematopoletic system; reproductive system; liver; skeletal muscle; neurodegenerative disease; amyotrophic lateral sclerosis; Parkinson's disease; Huntingdon's disease; muscular mass; paralysis; cancer; obesity; fertility; endometriosis; blastocyst implantation; thrombosis; retinal disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a human CLF-1 protein. The specification describes a complex comprising a NNT-1 protein and a CLF-1 and/or sCNTFRalpha protein. The NNT-1/CLF-1 complex is used to modulate activity of the sCNTFRalpha/gpi30/LirRbeta receptor complex, or to induce chosphory/lation of the tyrosine of gpi30 and LiFRbeta, particularly where cells expressing the receptor complex are in the central or peripheral nervous system, in neurons implicated in neuro-muscular function or in skeletal muscle. The complex or antibodies are also used to decrease the survival, growth or proliferation of tumour cells or to facilitate the proliferation and/or inhibit differentiation of cells stocks. The complex is also used to modulate activity of the gpi30/LiFRbeta receptor or cells expressing that receptor, particularly those cells implicated in the immune, haematopoietic, nervous or reproductive system, the liver or skeletal muscle. Molecules of the invention may be used to prevent or treat neurodegenerative diseases including amyotrophic lateral sclerosis, muscular tissue or to maintain muscular mass in paralysis patients. They
